

ABSTRACT OF THE DISCLOSURE

An attachment for a cleaning appliance includes a head and a neck, the neck being adapted to be connected to the mouth of a wand or hose of the cleaning appliance. The neck has a first portion which, in use, lies alongside the mouth of the wand or hose and a second portion which, in use, is spaced away from the mouth of the wand or hose. This arrangement provides a bleed air passageway which allows atmospheric air to be bled into the hose or wand so as to reduce the suction at the main suction opening of the attachment. It also provides an advantageous storage solution for the attachments of the cleaning appliance.
